

ESMOGBALANCER PORTABLE

The **ESMOGBALANCER PORTABLE** is a device developed on the basis of spectral analysis, which serves to balance electromagnetic fields. It also combines the energy-harmonizing properties of FOSTAC® Technology with the spectral-dynamic compensation of CME Technology.

This system functions as a kind of breakwater that balances or smoothes the chaotic waves of EMF, making them more tolerable for living organisms.

The ESMOGBALANCER PORTABLE builds, depending on the situation, an effective range of 4 - 6 m (2 - 3 m diameter). Within this sphere of action, electrosmog intensity peaks are balanced, so that they are more tolerated by the organism.

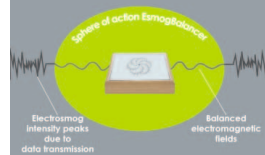

It was especially developed for the use in modern vehicles (especially hybrid and electric cars). The supplied cable allows connection to a USB socket (e.g. cigarette lighter).

It is essential that the device is well secured in the vehicle so that it cannot cause damage in the event of a sudden manoeuvre.

The ESMOGBALANCER PORTABLE is also suitable in combination with the three FOSTAC® technologies. By overlapping the fields of action these technologies support each other.

FUNCTIONAL DIAGRAM

TECHNICAL DETAILS

Material: Wooden case with electronics
Size: 22.5 x 17.5 x 5.5 cm
Weight: approx. 1.2 kg net
